

Amendments to the Claims:

The listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1 - 3. (Canceled)

4. (Original) A head-up display system comprising:

a transparent plate;

a liquid crystal display for generating a display light of information; and

a laminate of first and second $\lambda/4$ films, said laminate configured on a display panel of said liquid crystal display such that said display light is changed into S-polarized light or P-polarized light and that said S-polarized light or said P-polarized light is incident on said transparent plate,

wherein when a polarization direction of said display light is inclined at a first angle to a horizontal axis of said display panel, said first $\lambda/4$ film is disposed such that a fast axis of said first $\lambda/4$ film has an inclination at a second angle relative to a horizontal axis of said first $\lambda/4$ film, said second angle being a total of said first angle and 45 degrees, and

~~A head-up display system according to claim 3,~~ wherein said second $\lambda/4$ film is disposed such that a fast axis of said second $\lambda/4$ film has an inclination at a third angle of -45 or 135 degrees relative to a horizontal axis of said second $\lambda/4$ film, thereby changing said display light into said S-polarized light.

5. (Original) A head-up display system comprising:

a transparent plate;

a liquid crystal display for generating a display light of information; and
a laminate of first and second $\lambda/4$ films, said laminate configured on a
display panel of said liquid crystal display such that said display light is changed
into S-polarized light or P-polarized light and that said S-polarized light or said
P-polarized light is incident on said transparent plate

wherein, when a polarization direction of said display light is inclined at a
first angle to a horizontal axis of said display panel, said first $\lambda/4$ film is disposed
such that a fast axis of said first $\lambda/4$ film has an inclination at a second angle
relative to a horizontal axis of said first $\lambda/4$ film, said second angle being a total
of said first angle and 45 degrees, and

~~A head-up display system according to claim 3,~~ wherein said second $\lambda/4$
film is disposed such that a fast axis of said second $\lambda/4$ film has an inclination at
a third angle of -135 or 45 degrees relative to a horizontal axis of said second $\lambda/4$
film, thereby changing said display light into said P-polarized light.

6 - 16. (Canceled)
